C. 12 Day
2. Day/Time of Regeneration:
3. Drain Line Flow Control: gpm
4. Brine Refill Rate: gpm
5. Injector Size#:

## INSTALLATION AND START-UP PROCEDURE

The water softener should be installed with the inlet, outlet and drain connections made in accordance with manufacturer's recommendations and to meet applicable plumbing codes.

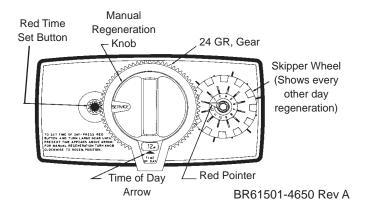

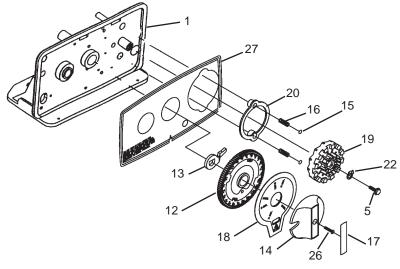

Figure 1

 Manually index the softener control into the service position and let water flow into the resin tank. When the water flow stops, open a softened water tap until all air is released from the lines, then close the tap.

Note: The various regeneration positions may be dialed manually by turning the knob on the front of the control until the indicator shows that the softener is in the desired position.

- 2. Manually index the control to the backwash position and allow water to flow at the drain for 3 or 4 minutes.
- 3. Remove back cover plate.
- Make sure that the salt dosage is set as recommended by the manufacturer. Manually index the control to the brine fill position and allow the brine tank to fill to the top of the air check.
- Manually index the control to the brine draw position and allow the control to draw water from the brine tank until it stops.
- 6. Plug in the electrical cord and look in the sight hole in the back of the motor to see that it is running. Set the days that regeneration is to occur by sliding tabs on skipper wheel outward to expose trip fingers. Each tab is one day. Finger at red pointer is tonight. Moving clockwise from red pointer, extend or retract fingers to obtain the desired regeneration schedule.
- Manually advance the control to the beginning of the brine fill position; and allow the control to return to the service position automatically.
- 8. Fill the brine tank with salt.
- 9. Replace back cover on the control.
- 10. Make sure that any bypass valving is left in the normal service position.

### CONTROL VALVE DRIVE ASSEMBLY

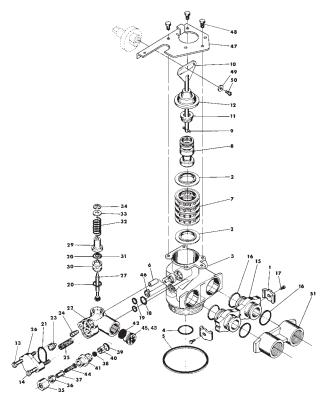

BR61501-4650 Rev A

Item No.	QTY	Part No.	Description
1	1	15494-01	"L" Housing - w/Pin

## WATER CONDITIONER FLOW DIAGRAMS

#### 1 Service Position

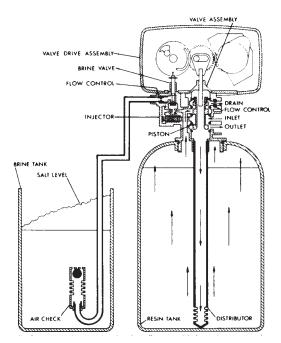

Hard water enters the unit at the valve inlet - flows around the lower piston groove - thru the passage to the top of tank - down thru the resin and enters the distributor as conditioned water. The conditioned water flows up thru the center tube to the valve outlet.

#### 2 Preliminary Rinse Position (5 Minutes)

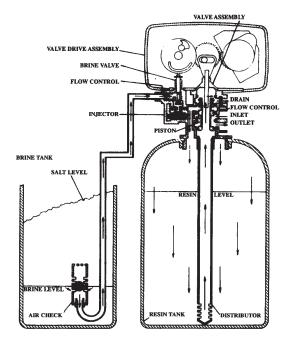

Hard water enters the unit at the valve inlet - flows around the lower piston groove - down thru the top of tank passage - downward thru the resin - up the distributor tube - thru the center hole in the piston - over the top edge of the piston and out the drain line.

#### 3 Backwash Position (10 Minutes)

Hard water enters the unit at the valve inlet - flows around the lower piston groove and lower piston land - down thru the center tube and out the distributor - up thru the resin - thru the top of tank passage - around the upper piston groove and out the drain line.

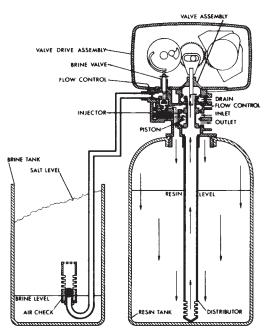

#### 4 Brine Position (First Portion of 50 Minute Fixed Cycle)

Hard water enters the unit at the valve inlet - flows around the lower piston groove - thru the injector nozzle and orifice to draw brine from the brine tank. The brine flows down thru the resin - into the distributor - up thru the center tube - thru the center hole in the piston and out the drain line.

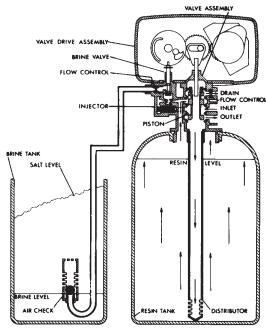

## WATER CONDITIONER FLOW DIAGRAMS continued

#### 5 Slow Rinse Position (Last Portion of 50 Minute Fixed Cycle)

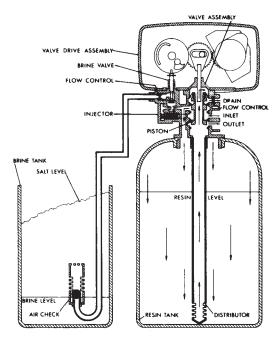

After all the brine has been drawn from the brine tank, hard water continues to enter thru the valve inlet - flows around the lower piston groove - thru the nozzle and orifice - down thru the resin and into the distributor - up thru the center tube - thru the center hole in the piston and out the drain line.

#### 6 Second Backwash Position (10 Minutes)

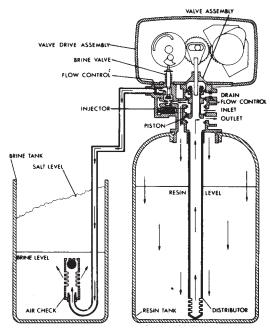

Hard water enters the unit at the valve inlet - flows around the lower piston groove and lower piston land - down thru the center tube and out the distributor - up thru the resin - thru the top of tank passage - around the upper piston groove and out the drain line.

#### 7 Settling Rinse Position (5 Minutes)

Hard water enters the unit at the valve inlet - flows around the lower piston groove - down thru the top of tank passage - downward thru the resin - up the distributor tube - thru the center hole in the piston - over the top edge of the piston and out the drain line.

#### 8 Brine Tank Fill Position (4 to 24 Minutes Adjustable Cycle)

Hard water enters the unit at the valve inlet - flows around the lower piston groove - thru the injector throat - thru the brine valve and flow control to fill the brine tank. Hard water also flows around the lower piston groove - thru the passage to the top of tank - down thru the resin and enters the distributor as conditioned water. The conditioned water flows up thru the center tube to the valve outlet.

#### SERVICE INSTRUCTIONS

## A. TO REMOVE TIME BRINE VALVE, INJECTORS, AND SCREEN

- 1. Unplug electrical cord from outlet.
- 2. Turn off water supply to conditioner:
  - a. If the conditioner installation has a "three valve" bypass system, first open the valve in the bypass line, then close the valves at the conditioner inlet and outlet.
  - b. If the conditioner has an integral bypass valve, put it in the bypass position.
  - c. If there is only a shut-off valve near the conditioner inlet, close it.
- Relieve water pressure in the conditioner by putting the control in the backwash position momentarily. Return the control to the service position.
- Disconnect brine tube and drain line connections at the injector body.
- Remove the two injector body mounting screws. The injector and brine module can now be removed from the control valve. Remove and discard valve body O-rings.
- 6. To replace brine valve:
  - a. Pull brine valve from injector body, also remove and discard O-ring at bottom of brine valve hole.
  - Apply silicone lubricant to new O-ring and reinstall at bottom of brine valve hole.
  - Apply silicone lubricant to O-ring on new valve assembly and press into brine valve hole, shoulder on bushing should be flush with injector body.
- 7. To replace injectors and screen:
  - Remove injector cap and screen, discard O-ring.
     Unscrew injector nozzle and throat from injector body.
  - b. Screw in new injector throat and nozzle. Be sure they are seated tightly. Install a new screen.
  - Apply silicone lubricant to new O-ring and install around oval extension on injector cap.
- Apply silicone lubricant to three new O-rings and install over three bosses on injector body.
- Insert screws with washers through injector cap and injector. Place this assembly through hole in timer housing and into mating holes in the valve body. Tighten screws. Be sure to reinstall brass spacers with injector on Model 4600 valve.
- 10. Reconnect brine tube and drain line.
- 11. Return bypass or inlet valving to normal service position. Water pressure should now be applied to the conditioner, and any bypass line shut off.
- 12. Check for leaks at all seal areas. Check drain seal with the control in the backwash position.
- 13. Plug electrical cord into outlet.
- 14. Set time of day and cycle the control valve manually to ensure proper function. Make sure the control valve is returned to the service position.
- 15. Make sure there is enough brine in the brine tank.
- 16. Rotate program wheel counterclockwise until it stops at regeneration position.
- 17. Start regeneration cycle manually if water is hard.

#### **B. TO REPLACE TIMER**

- Unplug electrical cord from outlet.
- 2. Turn off water supply to conditioner:
  - a. If the conditioner installation has a "three valve" bypass system, first open the valve in the bypass line, then close the valves at the conditioner inlet and outlet.
  - b. If the conditioner has an integral bypass valve, put it in the bypass position.
  - If there is only a shut-off valve near the conditioner inlet, close it.
- 3. Relieve water pressure in the conditioner by putting the control in the backwash position momentarily. Return the control to the service position.
- 4. Remove the control valve back cover.
- Remove screw and washer at drive yoke. Remove timer mounting screws. The entire timer assembly will now lift off easily.
- Put new timer on top of valve. Be sure drive pin on main gear engages slot in drive yoke (rotate control knob if necessary).
- 7. Replace timer mounting screws. Replace screw and washer at drive yoke.
- Return bypass or inlet valving to normal service position. Water pressure should now be applied to the conditioner, and any bypass line shut off.
- 9. Plug electrical cord into outlet.
- Set time of day, program wheel, and salt usage. Cycle
  the control valve manually to ensure proper function.
  Make sure the control valve is returned to the service
  position.
- 11. Replace the control valve back cover. Be sure grommet at cable hole is in place.
- 12. Make sure there is enough brine in the brine tank.
- 13. Rotate program wheel counterclockwise until it stops at regeneration position.
- 14. Start regeneration cycle manually if water is hard.

#### SERVICE INSTRUCTIONS continued

#### C. TO REPLACE PISTON ASSEMBLY

- 1. Unplug electrical cord from outlet.
- 2. Turn off water supply to conditioner:
  - a. If the conditioner installation has a "three valve" bypass system, first open the valve in the bypass line, then close the valves at the conditioner inlet and outlet
  - b. If the conditioner has an integral bypass valve, put it in the bypass position.
  - If there is only a shut-off valve near the conditioner inlet, close it.
- Relieve water pressure in the conditioner by putting the control in the backwash position momentarily. Return the control to the service position.
- 4. Remove the control valve back cover.
- Remove screw and washer at drive yoke. Remove timer mounting screws. The entire timer assembly will now lift off easily. Remove end plug retainer plate.
- Pull upward on end of piston yoke until assembly is out of valve.
- Inspect the inside of the valve to make sure that all spacers and seals are in place, and that there is no foreign matter that would interfere with the valve operation.
- 8. Take new piston assembly as furnished and push piston into valve by means of the end plug. Twist yoke carefully in a clockwise direction to properly align it with drive gear. Replace end plug retainer plate.
- Place timer on top of valve. Be sure drive pin on main gear engages slot in drive yoke. Rotate control knob if necessary.
- Replace timer mounting screws. Replace screw and washer at drive yoke.
- Return bypass or inlet valving to normal service position. Water pressure should now be applied to the conditioner, and any bypass line shut off.
- 12. Plug electrical cord into outlet.
- Set time of day. Cycle the control valve manually to ensure proper function. Make sure the control valve is returned to the service position.
- Replace the control valve back cover. Be sure grommet at cable hole is in place.
- 15. Make sure there is enough brine in the brine tank.
- Rotate program wheel counterclockwise until it stops at regeneration position.
- 17. Start regeneration cycle manually if water is hard.

#### D. TO REPLACE SEALS AND SPACERS

- 1. Unplug electrical cord from outlet.
- 2. Turn off water supply to conditioner:
  - a. If the conditioner installation has a "three valve" bypass system, first open the valve in the bypass line, then close the valves at the conditioner inlet and outlet.
  - b. If the conditioner has an integral bypass valve, put it in the bypass position.
  - c. If there is only a shut-off valve near the conditioner inlet, close it.
- Relieve water pressure in the conditioner by putting the control in the backwash position momentarily. Return the control to the service position.
- 4. Remove the control valve back cover.
- Remove screw and washer at drive yoke. Remove timer mounting screws. The entire timer assembly will now lift off easily. Remove end plug retainer plate.
- Pull upward on end of piston rod yoke until assembly is out of valve. Remove and replace seats and spacers with fingers.

### **TROUBLESHOOTING**

Problem	Possible Cause	Solution
Softener fails to regenerate	Electrical service to unit has been interrupted.	Ensure permanent electrical service (check fuse, plug, pull chain or switch).
	Timer is defective.	Replace timer.
	Power failure	Reset time of day.
Softener delivers hard water	Bypass valve is open.	Close bypass valve.
	No salt in brine tank.	Add salt to brine tank and maintain salt level above water level.
	Injectors or screen plugged.	Replace injectors and screen.
	Insufficient water flowing into brine tank.	Check brine tank fill time and clean brine line flow control if plugged.
	Hot water tank hardness.	Repeated flushings of the hot water tank is required.
	Leak at distributor tube.	Make sure distributor tube is not cracked. Check O-ring and tube pilot.
	Internal valve leak.	Replace seals and spacers and/or piston.
Unit uses too much salt	Improper salt setting.	Check salt usage and salt setting.
	Excess water in brine tank.	See problem Excessive water in brine tank below.
Loss of water pressure	Iron buildup in line to water conditioner.	Clean line to water conditioner.
	Iron buildup in water conditioner.	Clean control and add resin cleaner to resin bed. Increase frequency of regeneration.
	Inlet of control plugged due to foreign material broken loose from pipes by recient work done on plumbing system.	Remove piston and clean control.
Loss of resin through drain line	Air in water system.	Ensure that well system has proper air eliminator control. Check for dry well condition.
Iron in conditioned water	Fouled resin bed.	Check backwash, brine draw and brine tank fill, increase frequency of regeneration. Increase backwash time.
Excessive water in brine tank	Plugged drain line flow control.	Clean flow control
Salt water in service line	Plugged injector system.	Clean injector and replace screen.
	Timer not cycling.	Replace timer.
	Foreign material in brine valve.	Clean or replace brine valve.
	Foreign material in brine line flow control.	Clean brine line flow control.
Softener fails to draw brine	Drain line flow control is plugged.	Clean drain line flow control.
	Injector is plugged.	Clean or replace injectors.
	Injector screen plugged.	Replace screen.
	Line pressure is too low.	Increase line pressure. Line pressure must be at least 20 psi at all times.
	Internal control leak.	Change seals and spacers and/or piston assembly.
Control cycles continuous	Faulty timer mechanism.	Replace timer.
Drain flows continuously	Foreign material in control.	Remove piston assembly and inspect bore, remove foreign material and check control in various regeneration positions.
	Internal control leak.	Replace seals and/or piston assembly.
	Control valve jammed in brine or backwash position.	Replace seals and/or piston assembly.
	Timer motor stopped or jammed.	Replace timer.
