Hanna Mini Controllers are the perfect solution for Water Analysis and Control

# MINI CONTROLLERS

Traditionally, process monitoring and control has required considerable investment in system design, equipment, maintenance and training. With the introduction of the BL Series Mini-Controllers, Hanna provides a solution for industries that require reliable, efficient and affordable process monitoring and control.

The new BL Series Mini-Controllers are easy to use, durable and provide precise monitoring and control of pH, ORP, TDS, EC, and Resistivity.

Each Mini-Controller is  $8 \times 5 \text{ cm} (3 \times 2^{"})$  in size and weighs less than 9 oz. The compact size and simplicity of design allows for easy installation and integration into almost any existing system.

Each model is a single set point controller designed to control the operation of a pump, valve or mechanical device for dosing, filling and emptying tanks and rerouting flow.

The control action of each Mini-Controller can be disabled, set to automatic or manually operated directly from the front panel.

A selectable "Overtime" overdosing system can deactivate a valve, pump, or other connected device if activation continues for more than the set time, which is adjustable from 5 up to 30 minutes.

Any system can be cost effectively monitored 24 hours a day.

## 32 Models To Measure Conductivity, TDS, Resistivity, pH and ORP

#### **pH Mini-Controllers**

Monitoring and controlling pH in water conditioning and industrial applications is essential for water quality and maintaining infrastructure (piping and equipment). In the case of industrial effluent, neutralization of acidic waste is vital for environmental safety and public health. In industrial applications such as boiler feed water conditioning, a higher pH of 8.5 is necessary to prevent scaling and corrosion of critical components. Maintaining a pH of 7.2 is fundamental for proper and efficient sanitization in swimming pools and spas. The effectiveness of sanitizers such as chlorine is dependent on a controlled pH value.

#### **ORP Mini-Controllers**

ORP (Oxidation Reduction Potential) is the most dependable and consistent indicator of the sanitizing effectiveness of your pool, spa or treatment water. As oxidizers such as chlorine, peroxide and O-zone are added to water for the purpose of sanitization, the ORP value increases, providing a clear indication of the cleansing power of the water. Typically, an ORP value of 650 to 700 mV at a pH of 7.2 indicates that your water is properly treated and all harmful bacteria are killed in less than 1 second. ORP is also essential in chemical processing where reducing agents are used and a negative ORP value is an indicator of proper neutralization.

#### **Conductivity Mini-Controllers**

In water, an increase in conductivity indicates an increase in water hardness and a decrease in purity.

Conductivity monitoring and control is essential in reducing water hardness and maintaining water quality. For instance, water with a conductivity value in the range of 0-140  $\mu$ S is considered "very soft" where as water with a range of 640-840 µS is considered "hard" water. An increase in conductivity indicates an increase in the amount of damaging dissolved solids (salts) present in water. Conductivity monitoring and control is essential in industrial applications such as feed water control. blow down activation in cooling towers and water management where high conductivity will cause scaling and corrosion of piping and damage to critical components.

#### **TDS Mini-Controllers**

TDS measurement is an important indicator of water quality. An increase in the TDS reading indicates an increase in the amount of dissolved solids (salts) present in the water. TDS monitoring and control is imperative in industrial applications such as feed water control, blow down activation in cooling towers and water management where high TDS will cause scaling and corrosion of piping and damage to critical components.

TDS measurement is also an important indicator of the effectiveness of water conditioning since an increase in TDS indicates an increase in water hardness and a decrease in purity. This will affect the quality of drinking water, feed water and rinse water. TDS monitoring and control is crucial in reducing water hardness and maintaining water quality and usability.

Contact close when measure > Setpoint

Resistivity, measured in  $M\Omega$  (Ohm's), is the optimal way to measure the quality of water produced by high purity systems such as R.O systems and water conditioning equipment. As filter systems become less effective, the resistivity value will decrease indicating a need for maintenance and/or replacement of filters and critical components. Properly functioning RO and water conditioning systems will consistently produce water with resistivity readings in the range of 16 to  $18M\Omega$ .

## Solutions

## **pH Solutions**

Part No.	pH Value at 25°C	Size
HI 7004L	4.01	500 mL
HI 7004/1L	4.01	1 Liter
HI 7004/1G	4.01	1 US Gallon
HI 7007L	7.01	500 mL
HI 7007/1L	7.01	1 Liter
HI 7007/1G	7.01	1 US Gallon
HI 7010L	10.01	500 mL
HI 7010/1L	10.01	1 Liter
HI 7010/1G	10.01	1 US Gallon

## **pH Technical Buffers**

Part No.	Description	Size
HI 5001	pH 1.00 at 25°C	500 mL
HI 5002	pH 2.00 at 25°C	500 mL
HI 5005	pH 5.00 at 25°C	500 mL
HI 5006	pH 6.00 at 25°C	500 mL
HI 5008	pH 8.00 at 25°C	500 mL
HI 5009	pH 9.00 at 25°C	500 mL
HI 5011	pH 11.00 at 25°C	500 mL
HI 5012	pH 12.00 at 25°C	500 mL
HI 5013	pH 13.00 at 25°C	500 mL

## **ORP Solutions**

Part No.	Description	Size	
HI 7020L	Test solution 200-275 mV	460 mL	
HI 7021L	Test solution 240 mV	460 mL	
HI 7022L	Test solution 470 mV	460 mL	

## **ORP Pretreatment Solutions**

Hanna storage solutions are prepared with high grade potassium chloride and potassium hydrogen phthlalate by titration with NIST 2201 standardized sodium hydroxide solution, respectively.

By conditioning ORP electrodes in a Hanna pretreatment solution, measurements can be sped up.

Part No.	Description	Size	
HI 70300L	Storage solution	460 mL	
HI 7091L	Pretreatment reducing solution	460 mL	
HI 7092L	Pretreatment oxidizing solution	460 mL	

## **Conductivity Solutions**

Part No.	Conductivity Value at 25°C	Size
HI 7030L	12880 µS/cm (µmho/cm)	460 mL
HI 7031M	1413 µS/cm (µmho/cm)	230 mL
HI 7033L	84 µS/cm (µmho/cm)	460 mL
HI 7039L	5000 $\mu$ S/cm ( $\mu$ mho/cm)	460 mL

## **Total Dissolved Solids (TDS) Solutions**

Hanna is one of the few manufacturers offering preformulated Total Dissolved Solids solutions for lab and field calibration. Each solution is prepared using high grade Potassium Chloride standardized with a meter pre-calibrated with NIST 999 KCl and conforming to NIST 2201 Silver Nitrate solution.

Part No.	Conductivity Value at 25°C	Size
HI 7032L	1382 ppm (mg/L)	460 mL
HI 7036L	12.41 ppt (g/L)	460 mL

### **Cleaning Solutions for Electrodes**

Clean the liquid junction of the electrodes once a day or at least once a week to prevent clogging and to maintain accuracy.

Part No.	Description	Size	
HI 7061L	General purpose solution	460 mL	
HI 7074L	Inorganic cleaning solution	460 mL	

#### Solutions manufactured to your application

It is difficult to exaggerate the importance of buffer and maintenance solutions. Expensive equipment is often utilized well below its full capabilities due to lack of proper maintenance of sensors. With Hanna solutions, this is no longer a problem. All solutions are prepared with carefully weighed chemicals of the highest grade following International Laboratory Practice guidelines. Due to the sheer volume of solutions produced, the quantity of chemicals used provides a much better resolution than if small volumes were prepared by a laboratory technician. HANNA solutions give the user the advantage of being able to perform accurate calibration at a minimal cost.
